COMPANION DOCUMENT

AMS System Map: code and README at github.com/bradymccor24-arch/ams-system-map. A read-only data product over a Teamworks AMS: 570 forms and 71,187 links mapped; 871 broken references and 893 incorrect calculated values found; 12 phases, 153 steps, shipped end to end.

POSITIONING

I am the user I design for

Applied sports scientist who designs the tools. Four years building decision software for the coaches, analysts, and performance staff I have worked alongside.

The domain

MS Biokinesiology (USC), CSCS. Four years inside performance departments at Texas, Maryland, Fresno State, and LA Giltinis.

The users

Coaches, sports scientists, analysts, clinicians, and athletes. I have sat on both sides of every tool I have built.

The systems

Catapult, VALD ForceDecks, 1080 Sprint, Perch, SmartSpeed. R, SQL, Azure, Power BI. I know how the data actually moves.

The gap I close

Performance software usually fails because the designer does not understand the question the coach is asking at 6am.

WHY THIS ROLE

I want to build the tools I have spent four years using and working around. Inside performance departments at Texas, Maryland and Fresno State I turned GPS, force plate, sprint and wearable data into decisions coaches act on, and most recently built a data product over UT Athletics' Teamworks AMS. I bring the user's judgement and a record of shipping data tools people rely on.

Performance Signal Explorer

A force-time analysis tool that let staff compare any lift, any athlete, on one consistent pipeline — including movements the vendor software refused to score.

Vendor software scored the tests, not the training

- Force plates recorded every rep, but the vendor platform only produced metrics for movements it recognised as standard tests.
- Hang cleans, snatches, power cleans from blocks, and loaded jumps generated raw traces with no comparable output.
- Staff could not compare a countermovement jump to a hang clean, because each was processed differently — or not at all.
- Metrics that did exist could not be audited. Nobody could see what filter or event detection produced a number.

> “Can we trust one number across six different lifts?”

Six user groups, six different question sets

Before writing code I built a stakeholder question framework, segmented by who I would be talking to. S&C, Sports Medicine, Coaches, Tech, Research, and Administration each want a different thing from the same dataset.

THE QUESTIONS I ASK ABOUT ANY METRIC

- What does this measure?
- What are the limitations?
- Who will use this information?
- How does this tie to being prepared to play?
- What changes to schedule or programming will affect this measure?

Six decisions, and what each one traded away

1 One pipeline, not vendor parity

Every lift runs the same filter and event detection. Traded exact reproduction of proprietary output for cross-lift comparability.

2 A common t = 0

All traces align to the velocity zero-crossing before the largest force rise, so timing metrics mean the same thing on a squat and a snatch.

3 Zero-phase filtering

A fourth-order Butterworth applied forward and back at 50 Hz. Costs compute; prevents peaks from shifting in time.

4 A 10 ms persistence rule

Sustained positive velocity required before an event is accepted, so sensor noise cannot be mistaken for the start of a lift.

5 Flag, do not hide

Reps where detection fails are surfaced in the interface rather than dropped. The user decides, not the algorithm.

6 Normalise to bodyweight

Relative force divides by athlete bodyweight, not system weight — the comparison coaches actually reason about.

Three surfaces, three different jobs

1 Trace Explorer

One athlete, one rep

Filter to a name, exercise, and set. Full force, velocity, acceleration, RFD and power curves with a live metric panel beside them.

2 Lift Comparison

One athlete, many lifts

Sortable cross-lift tables so a coach can ask which movement produced the most force, not just what a single rep looked like.

3 Methodology

Why you should believe it

Formulas, filter settings, mass assumptions, and a limitations section. The trust layer that made the other two usable.

Live artifact: Force_Explorer_Dashboard_DEIDENTIFIED.html — 234 repetitions, 6 athletes, 6 movement types.

CASE STUDY 02

Shoulder assessment: designing for a 30-second read

A pitching coach reads this between bullpens, not at a desk. The report had to survive being skimmed. Ten pitchers, two test positions, four metrics — enough data to become unreadable as a single composite score. A single ranking would have hidden the finding that mattered most: an athlete strong in one position and weak in another.

1. **Rank per position, not overall**
   Each test position gets its own ranked table, so positional weakness surfaces instead of averaging out.

2. **Percentile bands as colour**
   A four-band key turns twenty numbers into a pattern the eye resolves before the brain reads.

3. **Ratio beside magnitude**
   IR/ER ratio sits next to raw force, separating balance problems from strength problems.

4. **Findings split by action**
   Top Performers and Areas for Development, each ending in a specific recommendation.

CASE STUDY 03

A reporting system, not a pile of dashboards

1. **Nine sources, one contract**

   1080 Sprint, VALD ForceDecks and SmartSpeed, Catapult, Polar, PERCH, DEXA, availability. Each gets a documented workflow and its own cleaning script before it enters the database.

2. **Reports tiered by cadence**

   Daily, Weekly, Periodic, Planning, and Program History. The tier decides the altitude — a daily GPS report answers a different question than an all-time leaderboard.

3. **Every report documented the same way**

   Data Sources and Main Goal on each one. A consistent spec across twenty-plus reports is the closest thing sports science has to a design system.

DESIGN PRINCIPLE

The same data, redrawn for each person who needs it

COACH

Squad at a glance

Position-group averages, leaderboards, red/yellow/green banding. Built to be read standing up, in seconds.

PRACTITIONER

Relative to what?

Load compared against the athlete's own history and their position group — because a raw number means nothing without a baseline.

ATHLETE

This is you

One page, own results, pre/post change and position rank, with S&C notes in plain language. Designed to be handed to the person it describes.

Three institutions, three brands, one underlying reporting practice carried across all of them.

What I bring to a sports or health tech team

1. ### I have been the user

   Four years at three Division I programs, sitting with the staff who make player decisions and turning performance data into calls on readiness and availability. I know what makes a number trusted or ignored.

2. ### Complex data into something people can trust

   The AMS System Map traces where every value comes from across 71,187 links and checks 18 million records for quality, so staff can see why a number says what it says.

3. ### End to end, across data and engineering, without authority

   Discovery first, then 12 phases and 153 steps shipped: API integration, 13 data connectors, a pipeline, an app and a daily report, with sports science, IT and performance staff aligned on scope and governance.

4. ### AI tools in my own work

   I build with Claude Code under written rules that keep every session accountable: specs, prototyping, analysis and code review. It is how I work, not a line on a résumé.

Résumé available on request

ACSM Poster

Power Output as a Function Of Body Mass in Competitive Weightlifters

A. SQUILLANTE, B. MCCORMICK, L. MARTIN, E.T. SCHROEDER

CERC
CLINICAL EXERCISE RESEARCH CENTER

INTRODUCTION

- Evidence has shown a strong positive correlation between body mass (BM), lean body mass (LBM), and peak power output (PPO) in athletes, although the relative contribution of BM and LBM to PPO remains unclear;
- This study investigates the relationship between PPO (W) assessed in the mid-thigh power clean, BM (W·kg-1), and LBM (W·kg-1) in competitive weightlifters.

METHODS

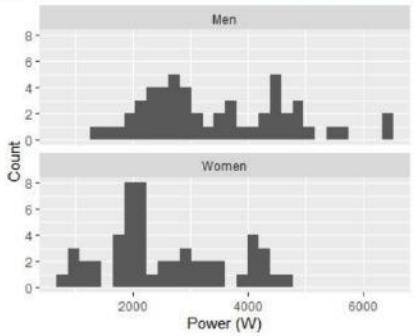

- 26 male and female weightlifters (average: age 25.5 ± 3.8, height 168.2 ± 4.6 cm, body mass 76.7 ±14.6 kg)
- Incremental loads of 20%, 30%, 40%, and 50% of the barbell back squat 1RM. 4 sets of 3 repetitions.
- BM and LBM were assessed using bioelectrical impedance analysis (InBody 570 USA, Cerritos, CA).

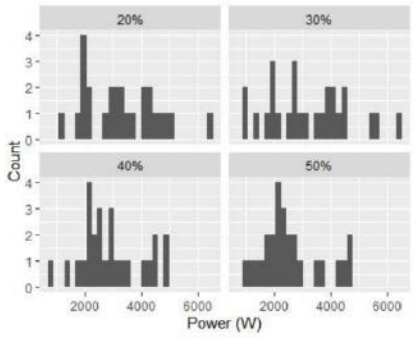

RESULTS

- To refrain from violating the assumptions, multicollinearity was examined through the implementation of the Variance Inflation Factor (VIF).
- The correlation between LBM and BBW was .945.
- A simple linear regression was performed to predict Power from Body Mass. The model's result revealed that Body Mass is a statistically significant predictor of Power, $F(1, 24) = 48.013$, $p < 0.001$, $R2 = .667$.

CONCLUSION

Body Mass was revealed to be a strong predictor for performance in competitive weightlifters. Future research should examine whether this finding holds true regardless of the sex of the competitive weightlifter.

2021 ACSM NATIONAL CONFERENCE

Questions from Applied Sports Scientist Sr. to the High Performance Staff

Strength & Conditioning

List of coach's names and main roles?

What weight room and field equipment do we have access to?

How is programming delivered to the athletes?

How are groups of athletes determined by the S&C staff?

When are lifting sessions?

Do all athletes train at the same time?

When is the field work/practice?

What is the current view of the sports science process?

What do they feel like works well so far?

What questions do they still have unanswered?

What do they feel like is not working well?

Athletic Qualities Profiles

Baseline assessment & monitoring

Catapult GPS Data

VALD Technologies data

Perch VBT data

Polar HR data

Return-to-Play data

Sports Medicine

Who is the primary rehab practitioner?

Who is the primary physician consultant?

Do most of the athletes get surgery from the same person? If yes, who is that?

How does insurance and medical coverage work for the athletes?

What information will best inform their rehab/planning?

What do they feel like works well so far?

What questions do they still have unanswered?

What do they feel like is not working well?

Integrate athletic qualities into on field performance

GPS & Video coordination

Objective Testing Clearance Marks

Tech

How-To collection guide

What does this measure?

What are the limitations?

How do we process the data?

Who will use this information?

How does this tie to being prepared to play the sport?

What changes to schedule/programming/etc will affect this measure?

Football Coaches

How does the coaching staff communicate with S&C, Medical, and Sports Science?

What information does the coaching staff use to inform practice planning and schedule?

Pro Football Focus Data

Integrate athletic qualities into on field performance

GPS & Video coordination

Objective Testing Clearance Marks

Research

What lab are we publishing through?
What is the main question we want to answer?
How does this question inform your practice or the field?
Is it useful information or a fun fact?
Will the benefit of the answer weigh enough for the work it takes to get there?
Cross-Sectional or Longitudinal?
How much commitment will this need from the coaches & athletes?

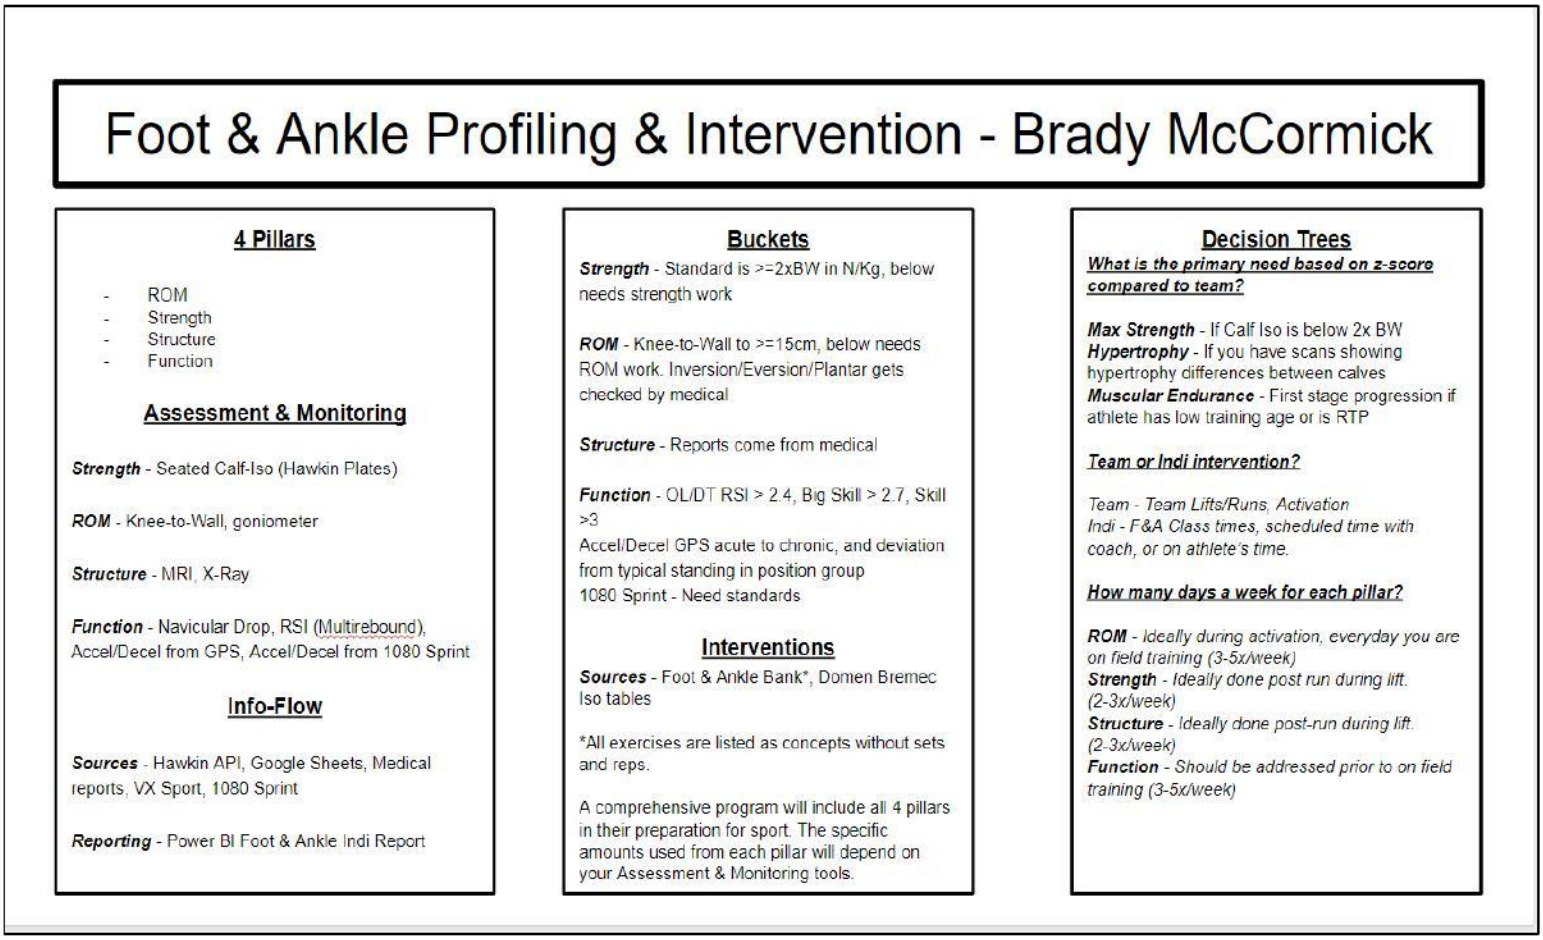

Administration

Who is the decision maker on new hires for Athletic Performance staff?

How is Sports Science viewed by the Administration?

Integrated Example: Foot & Ankle

Below is an example of how we can approach different areas of concern for overall athlete health & performance. First is an overview of how the philosophies and Sports Science technology integrating together into decision making. Followed by an example of RTP progressions from an ankle fracture. As well as a exercise library with progressions.

Foot & Ankle Profiling & Intervention - Brady McCormick

4 Pillars

- ROM
- Strength
- Structure
- Function

Assessment & Monitoring

Strength - Seated Calf-Iso (Hawkin Plates)

ROM - Knee-to-Wall, goniometer

Structure - MRI, X-Ray

Function - Navicular Drop, RSI (Multirebound), Accel/Decel from GPS, Accel/Decel from 1080 Sprint

Info-Flow

Sources - Hawkin API, Google Sheets, Medical reports, VX Sport, 1080 Sprint

Reporting - Power BI Foot & Ankle Indi Report

Buckets

Strength - Standard is >=2xBW in N/Kg, below needs strength work

ROM - Knee-to-Wall to >=15cm, below needs ROM work. Inversion/Eversion/Plantar gets checked by medical

Structure - Reports come from medical

Function - OL/DT RSI > 2.4, Big Skill > 2.7, Skill >3
Accel/Decel GPS acute to chronic, and deviation from typical standing in position group
1080 Sprint - Need standards

Interventions

Sources - Foot & Ankle Bank*, Domen Bremec Iso tables

*All exercises are listed as concepts without sets and reps.

A comprehensive program will include all 4 pillars in their preparation for sport. The specific amounts used from each pillar will depend on your Assessment & Monitoring tools.

Decision Trees

What is the primary need based on z-score compared to team?

Max Strength - If Calf Iso is below 2x BW
Hypertrophy - If you have scans showing hypertrophy differences between calves
Muscular Endurance - First stage progression if athlete has low training age or is RTP

Team or Indi intervention?

Team - Team Lifts/Runs, Activation
Indi - F&A Class times, scheduled time with coach, or on athlete's time.

How many days a week for each pillar?

ROM - *Ideally during activation, everyday you are on field training (3-5x/week)*
Strength - *Ideally done post run during lift. (2-3x/week)*
Structure - *Ideally done post-run during lift. (2-3x/week)*
Function - *Should be addressed prior to on field training (3-5x/week)*

Integrated Example: Weekly Session Plans

Calf Iso				
Week 1	**Pain**	**Weight**	**Sets**	**Reps**
Day 1				
A1) Squat Calf Pulse			3	20
A2) Band Distracted Squat P/R		BW	3	3
A3) Run Rocket Dowel FWD/BCK			3	15ydsE
B1) A-Frame Calf-Raise w/ :02 Pau			3	8
B2) Heel Float SL RDL		BW	3	10e
B3) Calf Stretch Walk		BW	3	10E
Day 2				
A1) Band Traction Series		Green	3	60s
A2) InchWorm		BW	3	4
A3) SL Balance on Pad		BW	3	30sE
B1) Inversion Holds		BW	3	30sE
B2) DL Calf Stretch		BW	3	20sE
B3) SL RDL Four Corners Taps		BW	3	3E
Day 3				
A1) Tall DL Calf Pulse			3	20
A2) Band Distracted Squat P/R		BW	3	3
A3) Single Leg Calf Sled		BW	3	20ydsE
B1) RFE Calf Raise (1,2,3 Hold)			3	3
B2) Heel Float Taps L/R		BW	3	5e
B3) Toe Reach Series		BW	3	5ydsE
Day 4				
A1) Band Traction Series		Green	3	60s
A2) Big Toe Calf Raise		BW	3	10E
A3) SL Balance on Pad		BW	3	30sE
B1) Inversion Holds		BW	3	30sE
B2) DL Calf Stretch		BW	3	20sE
B3) SL RDL Four Corners Taps		BW	3	3E
Day 5				
A1) Barbell DL Calf Pulse			3	60s
A2) Goblet Heel Float Walk		BW	3	3
A3) Band Traction DF		Purple	3	10
B1) Ankling Calf Sled			3	20yds
B2) BCK Sled Drag			3	20yds
B3) Dowel OH March Heel Float		BW	3	10yds

Calf Iso				
Week 2	**Pain**	**Weight**	**Sets**	**Reps**
Day 1				
A1) Squat Calf Pulse			3	20
A2) Band Distracted Squat P/R		BW	3	3
A3) Run Rocket Dowel FWD/BCK			3	15ydsE
B1) A-Frame Calf-Raise w/ :02 Pau			3	8
B2) Heel Float SL RDL		BW	3	10e
B3) Calf Stretch Walk		BW	3	10E
Day 2				
A1) Band Traction Series		Green	3	60s
A2) InchWorm		BW	3	4
A3) SL Balance on Pad		BW	3	30sE
B1) Inversion Holds		BW	3	30sE
B2) DL Calf Stretch		BW	3	20sE
B3) SL RDL Four Corners Taps		BW	3	3E
Day 3				
A1) Tall DL Calf Pulse			3	20
A2) Band Distracted Squat P/R		BW	3	3
A3) Single Leg Calf Sled		BW	3	20ydsE
B1) RFE Calf Raise (1,2,3 Hold)			3	3
B2) Heel Float Taps L/R		BW	3	5e
B3) Toe Reach Series		BW	3	5ydsE
Day 4				
A1) Band Traction Series		Green	3	60s
A2) Big Toe Calf Raise		BW	3	10E
A3) SL Balance on Pad		BW	3	30sE
B1) Inversion Holds		BW	3	30sE
B2) DL Calf Stretch		BW	3	20sE
B3) SL RDL Four Corners Taps		BW	3	3E
Day 5				
A1) Barbell DL Calf Pulse			3	60s
A2) Goblet Heel Float Walk		BW	3	3
A3) Band Traction DF		Purple	3	10
B1) Ankling Calf Sled			3	20yds
B2) BCK Sled Drag			3	20yds
B3) Dowel OH March Heel Float		BW	3	10yds

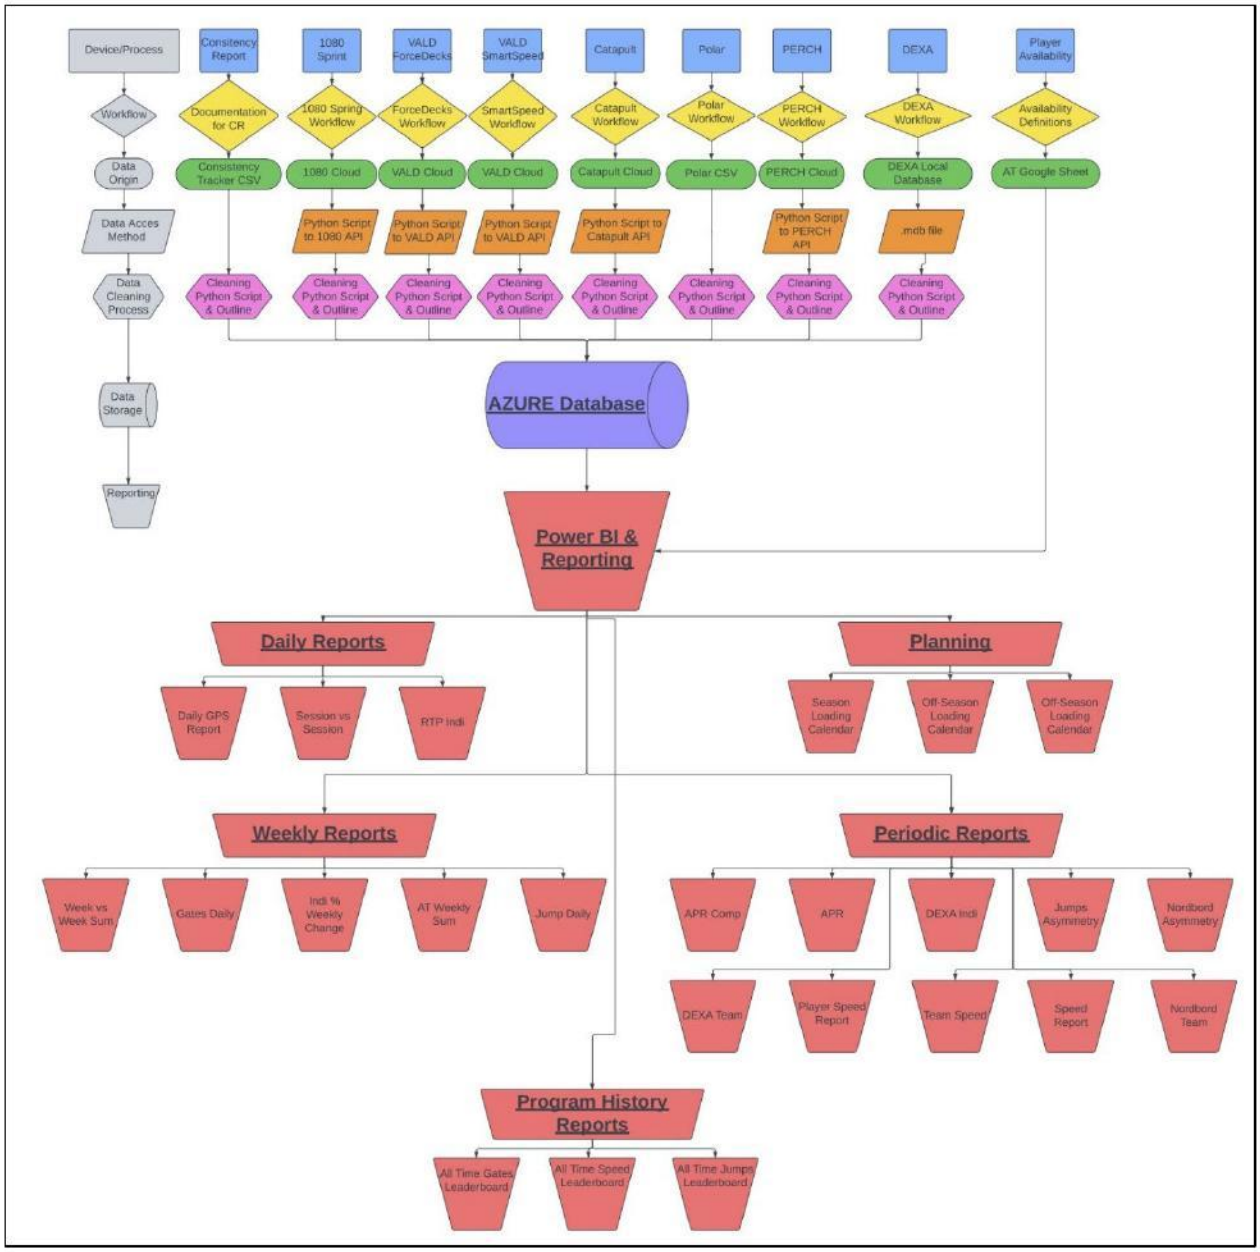

Integrated Example: Exercise Bank

Name	Category	Progression	Notes
Seated Calf Iso	Structure	BW, DB, Belt Strap	- Knees over ankles - Don't clench toes - Push through ball of foot - W/ or W/o Mini band around feet
Sprinter Calf Iso	Structure	Dowel, BB, Under Pins	- Stance knee should be locked out - Tall Chest - Don't clench toes - W/ or W/o mini band around feet
A-Frame	Strength	Dowel, Goblet, DB/KB, BB	- Stance knee should be locked out - Tall Chest - Drive foot up on bench/box
RFE Floating Heel	Strength	BW, Goblet, DB/KB, BB	- Stance foot on plate - Tall Chest - Don't clench toes
Standing Calf Raises	Strength	BW, DB/KB, BB, Single Leg	- Ball of foot on ledge - Core braced - Go from as low as heels can hang pressing up onto balls of feet
Calf Raise Marches	Strength	BW, DB/KB, BB	- Ball of foot on ledge - Go slow to start on stepping - Try to maintain plantar flexed through steps
SL Foot Arch Iso	Strength	BW, DB/KB, BB	- Two plates on ground, one for ball of foot, one for heel - Pull base of big to to heel to set arch - Sink down to slight bend in knee
Tall Sled Drags (FWD, BCK, Left, Right)	Strength	Prowler or Run Rocket	- Keep knees no further than slight bend - Clamp rib cage down - Emphasis pressing down and back with ball of foot on each step
Sled Drags (FWD, BCK, Left, Right)	Strength	Prowler or Run Rocket	- Knees can sink down as deep as needed - Stay on ball of foot (exception is backwards drag) - Press into and away on the ground
Wall Lean Calf-iso	Structure	Time & Effort	- Face perpendicular to wall - Using outside foot press in with emphasis on big toe - Using inside foot keep foot lat on ground with strong arch
Jump Rope	Function	Time & Speed	
Pogo Series	Function	FWD, BCK, Left, Right, Double Leg, Single Leg	- Tall posture with weight on mid-foot - Heels stay elevated - Fast as possible off the ground
Stadium Stairs	Function	Time & Speed	
Marches	Strength	BW, DB/KB, Belt Squat, SSB	- On mid to ball of foot - One leg up in knee drive - Stance leg pressing through ground
Traction Band Series (Dorsi, Inv, Ev, CARs)	ROM	Increase band tension	- Band is pulling inferior to leg - Band wraps around posterior heel under malleolus on both sides - Cross band over top of foot in x pattern around base of toes
Band Distacted Dorsi Flexion (Rocks, PAILs/RAILs)	ROM	Time & Effort	- Band frosses over top of foot pulling posteriorly - Split Stance, Squat Stance, or half kneeling - Keep heel down, press knee to pinky toe
Down Dog	ROM	Time & Effort	- Press finger tips into ground - Maintain long spine - Rock back and forth with feet, pressing throguh Plantar/Dorsi ROM

Data Flow Overview & Structure

Data Sources: All sources of information that goes into reporting.

Main Goal: To easily make data available for Stakeholders, a clear data flow and structure provides the best solution. Below is an example of what we built at the University of Maryland. Showing the pieces of the process from collection to reporting.

Driving Intent – Competition & Leaderboards

Data Sources: Force Plates, VBT, GPS/IMU, 1080 Sprint, Timing Gates, etc.

Main Goal: Using the KPIs for the team we can drive intent in the day of testing or assessment. As well as competition within the team. Additionally, we can drive conversation, if an athlete is not progressing consistently, it opens conversation with High Performance Practitioners on how the athlete can adjust to get the most out of training.

GPS Reporting – Team Session Overview

Data Sources: GPS & IMU

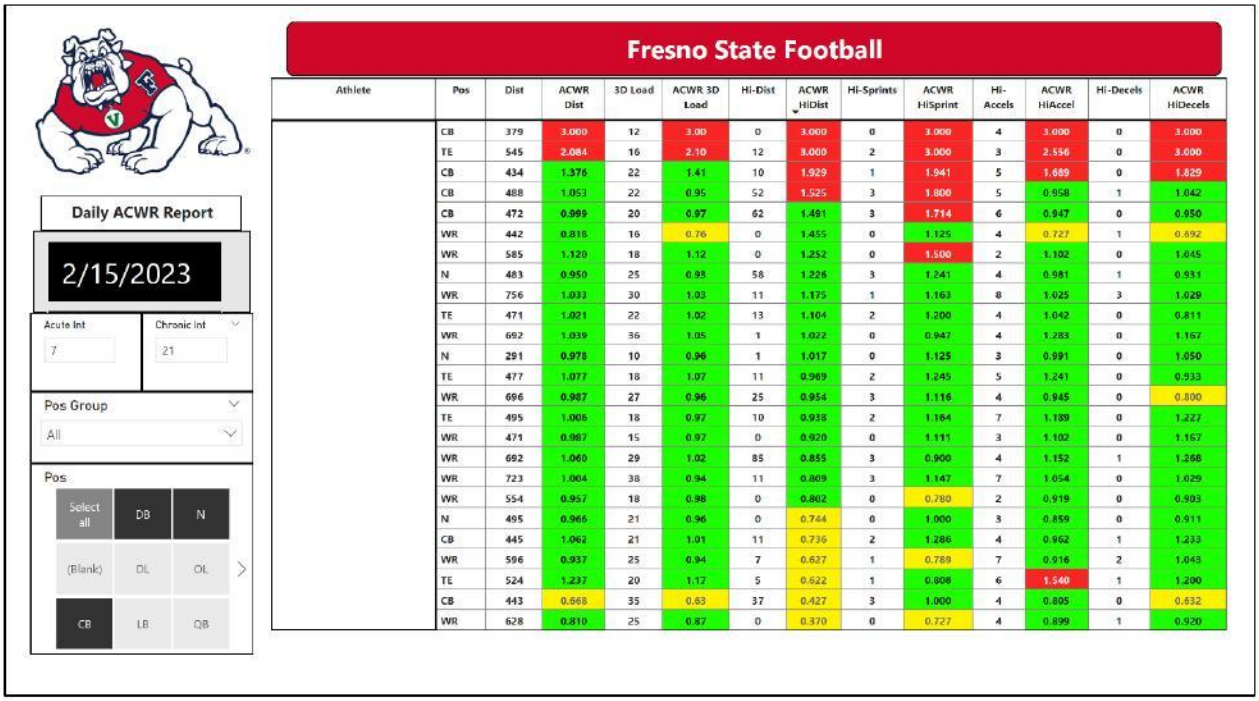

Main Goal: Give a brief snapshot of the day showing the averages by position group for key metrics as well as leaderboards for the highest volumes/speeds from the day.

GPS Reporting – Team Overview Relative to what?

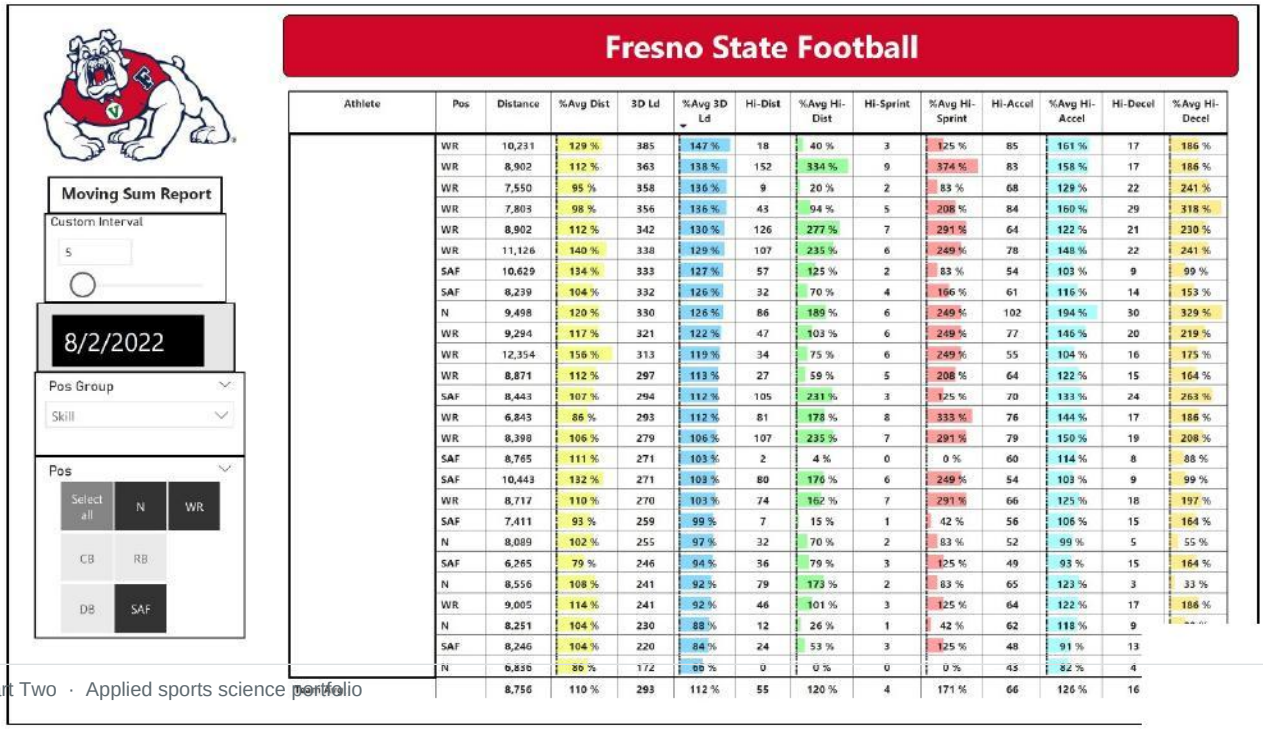

Data Sources: GPS & IMU

Main Goal: Dives deeper into what the day looks like compared to previous practices or games. Also provides insight into individual loads and how they compare historically to themselves and position group.

GPS Reporting – Speed Development

Data Sources: GPS, 1080 Sprint, Timing Gates

Main Goal: Speed is beneficial in almost every sport. Below are some ways that we communicate the changes in Speed and how we use our data to show development.

GPS Reporting – Drill Breakdown

Data Sources: GPS & IMU

Main Goals: In order to give insight into the structure of practice and how it influences overall session loading, we take a look at some examples of how we can breakdown the data by drill.

Daily Drill Report

2/21/2023

Heart Rate Reporting

Data Sources: GPS & IMU

Main Goal: Using Heart Rate monitoring to give insights into how the body is responding internally to the external loads.

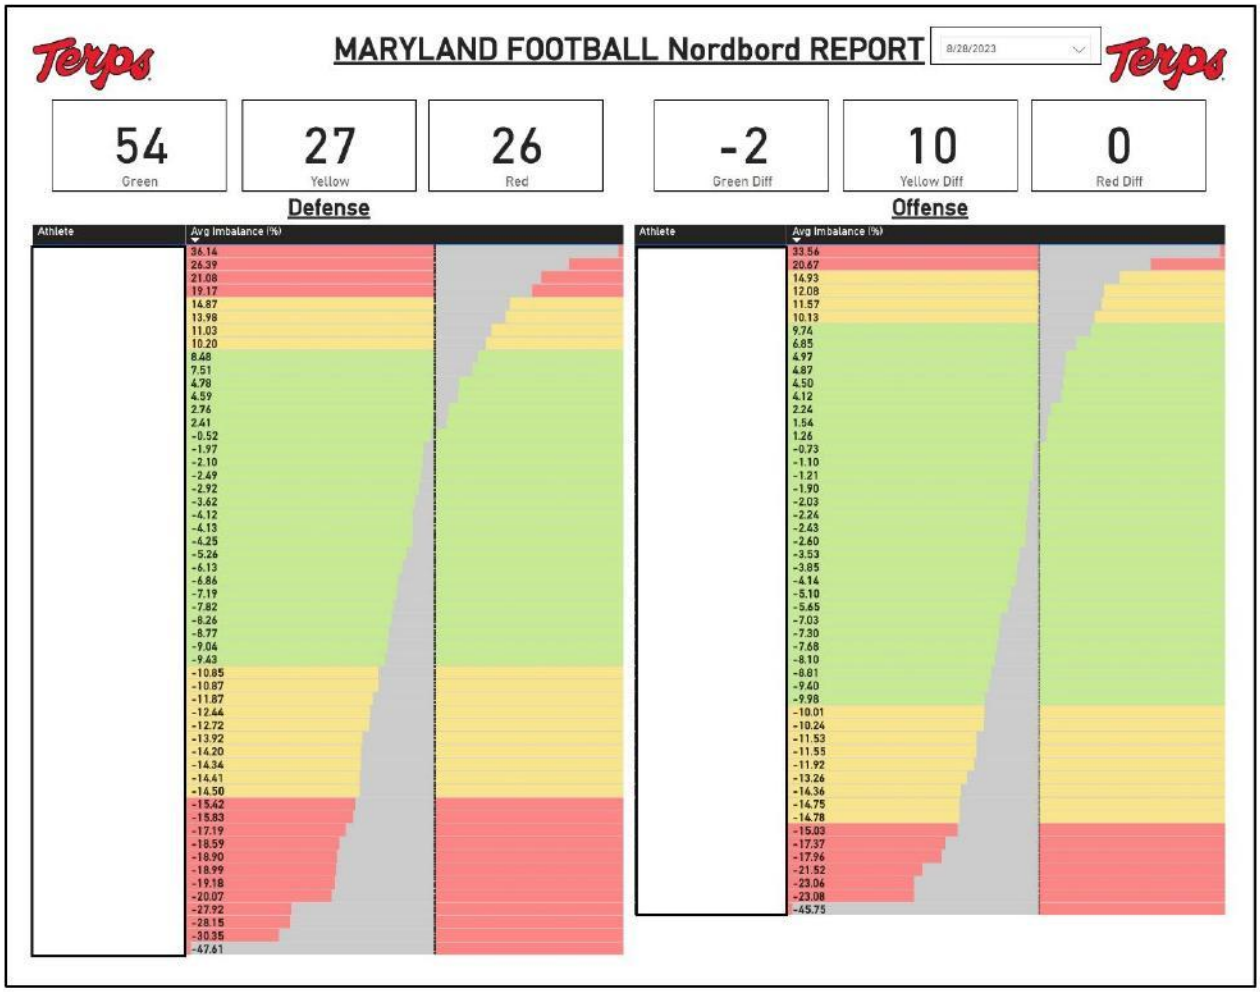

Athlete	Pos	Dur	Avg HR	Max HR	Avg HR %Max	TRIMP	HRZ01 (min)	HRZ02 (min)	HRZ03 (min)	HRZ04 (min)	HRZ05 (min)	Dist	HRZ1 Dist	HRZ2 Dist	HRZ3 Dist	HRZ4 Dist	HRZ5 Dist
